Connectra Backup — Managed backup and recovery

Your business can always roll back: end-to-end managed backup and assured recovery, with your data safeguarded off-site in Connectra's datacenter in Argentina.

Fully managed

Backup and recovery administered end to end by Connectra, with no operational burden on your team.

Data in Argentina

Off-site copies in Connectra's own datacenter, physically separated from your infrastructure.

No VPN required

Internet mode: devices back up from anywhere against the datacenter, with no local network or tunnels.

Assisted recovery

File-level or full bare-metal restore, guided by the Connectra team.

Connectra Backup automates the backup of your company's critical data without relying on user discipline or manual physical media. Agents capture files and full images from each device and send them to Connectra's datacenter, where they are versioned and protected.

The service operates in Internet mode: each agent backs up from any location against backup.connectra.com.ar, with no need to be on the company's local network. It is ideal for remote sites, camps and mobile fleets distributed across different locations.

— HOW IT WORKS

1

Assessment and policies

Together with your company we define which devices and data to protect, the copy windows and the retention and versioning policies.

2

Agent deployment

We install the UrBackup agent on each Windows or Linux PC and server, configured in Internet mode against Connectra's datacenter.

3

Automated off-site backup

Agents capture files and full images and send them encrypted to the datacenter, where they are versioned and kept out of band.

4

Monitoring and recovery

We oversee jobs with proactive alerts and assist with restoring files or entire systems whenever needed.

BENEFITS

- Data protected automatically, with no manual steps or physical media to manage.
- Fast recovery of files or entire systems to minimize downtime.
- Copies separated from your network that withstand ransomware attacks.
- Tailored retention that helps sustain audit and traceability requirements.
- Coverage of remote sites and mobile devices thanks to Internet mode.
- Local Connectra support, with data stored in Argentina.

INDUSTRY APPLICATIONS

- **Operational and engineering data**
Backup of drawings, geological models, plant data and engineering documentation from the mining operation, with versioning and history.
- **SCADA/PLC configurations**
Copy of control system and PLC configurations to restore them quickly after a failure or equipment replacement.
- **Reservoir data and telemetry historians**
Backup of reservoir databases and telemetry historians from wells and batteries, with configurable retention.
- **Control system configurations**
Copy of RTU, PLC and SCADA configurations at the wellhead and plants for fast restoration after failures.

WHAT SETS US APART

Own datacenter in Argentina

Your copies reside off-site in Connectra's in-country infrastructure, with data sovereignty and local support in Spanish.

VPN-free Internet mode

Each agent backs up from any location against the datacenter, covering remote sites and mobile fleets with no dedicated networks or tunnels.

Recovery managed by Connectra

You are not left alone during an incident: our team leads the assisted restore, including bare-metal, to reduce downtime.
